

## Positive voltage regulator ICs

TO-220

TO-220FP

DPAK

D²PAK

### Features

- Output current up to 1.5 A
- Output voltages of 5; 6; 8; 8.5; 9; 12; 15; 18; 24 V
- Thermal overload protection
- Short circuit protection
- Output transition SOA protection
- 2 % output voltage tolerance (A version)
- Guaranteed in extended temperature range (A version)

### Description

The **L78** series of three-terminal positive regulators is available in TO-220, TO-220FP, D²PAK and DPAK packages and several fixed output voltages, making it useful in a wide range of applications.

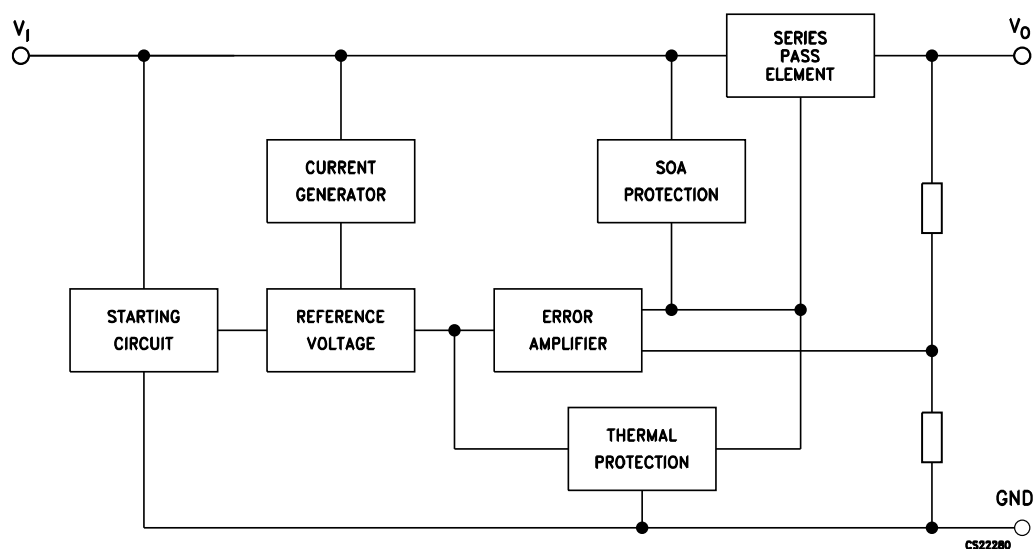

These regulators can provide local on-card regulation, eliminating the distribution problems associated with single point regulation. Each type embeds internal current limiting, thermal shut-down and safe area protection, making it essentially indestructible. If adequate heat sinking is provided, they can deliver over 1 A output current. Although designed primarily as fixed voltage regulators, these devices can be used with external components to obtain adjustable voltage and currents.

### 3 Maximum ratings

**Table 1. Absolute maximum ratings**

Symbol	Parameter		Value	Unit
$V_I$	DC input voltage	for $V_O = 5$ to $18$ V	35	V
		for $V_O = 20, 24$ V	40	
$I_O$	Output current		Internally limited	
$P_D$	Power dissipation		Internally limited	
$T_{STG}$	Storage temperature range		-65 to 150	°C
$T_{OP}$	Operating junction temperature range	for L78xxC, L78xxAC	0 to 125	°C
		for L78xxAB	-40 to 125	

**Note:** Absolute maximum ratings are those values beyond which damage to the device may occur. Functional operation under these condition is not implied.

## 6 Application information

### 6.1 Design consideration

The L78 Series of fixed voltage regulators are designed with thermal overload protection that shuts down the circuit when subjected to an excessive power overload condition, internal short-circuit protection that limits the maximum current the circuit will pass, and output transistor safe-area compensation that reduces the output short-circuit current as the voltage across the pass transistor is increased. In many low current applications, compensation capacitors are not required. However, it is recommended that the regulator input be bypassed with capacitor if the regulator is connected to the power supply filter with long lengths, or if the output load capacitance is large. An input bypass capacitor should be selected to provide good high frequency characteristics to insure stable operation under all load conditions. A 0.33  $\mu\text{F}$  or larger tantalum, mylar or other capacitor having low internal impedance at high frequencies should be chosen. The bypass capacitor should be mounted with the shortest possible leads directly across the regulators input terminals. Normally good construction techniques should be used to minimize ground loops and lead resistance drops since the regulator has no external sense lead.

The addition of an operational amplifier allows adjustment to higher or intermediate values while retaining regulation characteristics. The minimum voltage obtained with the arrangement is 2 V greater than the regulator voltage.

The circuit of [Figure 14. High current voltage regulator](#) can be modified to provide supply protection against short circuit by adding a short circuit sense resistor, RSC, and an additional PNP transistor. The current sensing PNP must be able to handle the short circuit current of the three terminal regulator. Therefore a four ampere plastic power transistor is specified.

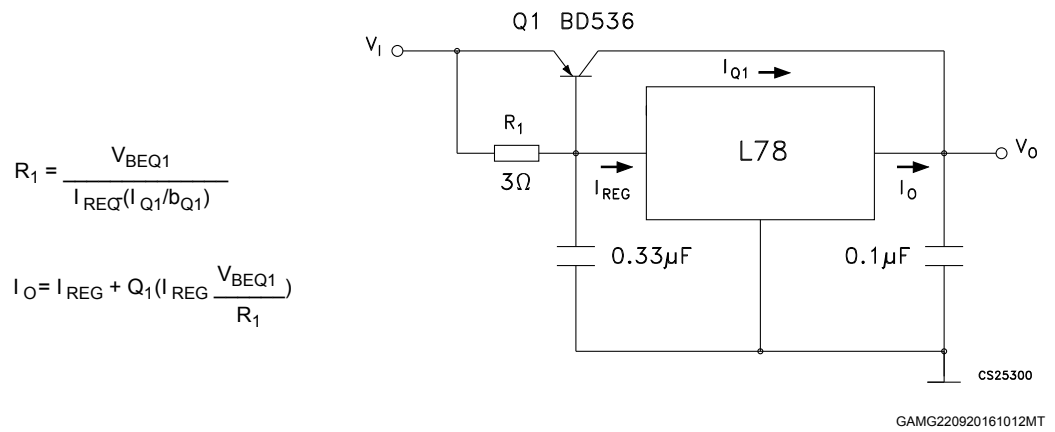

**Figure 9. Fixed output regulator**

1. Although no output capacitor is need for stability, it does improve transient response.
2. Required if regulator is located an appreciable distance from power supply filter.

**Figure 15. High output current with short circuit protection**

The diagram shows a two-stage circuit. The first stage is a voltage regulator using an L78 IC. Its input is  $V_I$  and its output is  $V_O$ . A  $0.33\mu\text{F}$  capacitor is connected between the input and ground (COMMON), and a  $0.1\mu\text{F}$  capacitor is connected between the output and ground. The second stage is a voltage follower using an LS141 op-amp. The non-inverting input (+) is connected to the output of the L78 regulator. The inverting input (-) is connected to the output of the op-amp, forming a voltage follower configuration. The output of the op-amp is also connected to ground through a  $4.7\text{K}\Omega$  resistor. The input to the op-amp is  $V_I$  and its output is  $V_O$ . A  $2\text{N}6124$  transistor is shown at the bottom, connected to the input  $V_I$  and the output  $V_O$  lines, but it is not connected to any other part of the circuit.

GAMG220920161014MT

The diagram shows a dual-polarity power supply circuit. It features two integrated circuit regulators: an L7815 (positive voltage regulator) and an L7915 (negative voltage regulator). The input to both regulators is a split supply consisting of a +20V terminal and a -20V terminal, with the common ground connected to the midpoint of a 2.2μF capacitor. The L7815 is connected with its input to the +20V line, its ground pin to the common ground, and its output to the +15V terminal. The L7915 is connected with its input to the -20V line, its ground pin to the common ground, and its output to the -15V terminal. Both regulators have a 0.33μF capacitor connected from their input lines to the common ground. The output of the L7815 has a 0.1μF capacitor connected to the +15V line and a 1μF capacitor connected to the common ground. The output of the L7915 has a 1μF capacitor connected to the -15V line and a 1μF capacitor connected to the common ground. Two 1N4001 diodes are connected in series across the output terminals (+15V and -15V) to provide protection against reverse polarity. The diode connected to the +15V line is marked with an asterisk (\*).

**Figure 28. Protection against input short-circuit with high capacitance loads**

GAMG220920161026MT

**Note:**

Application with high capacitance loads and an output voltage greater than 6 volts need an external diode (see [Figure 23. Reducing power dissipation with dropping resistor](#)) to protect the device against input short circuit. In this case the input voltage falls rapidly while the output voltage decrease slowly. The capacitance discharges by means of the base-emitter junction of the series pass transistor in the regulator. If the energy is sufficiently high, the transistor may be destroyed. The external diode by-passes the current from the IC to ground.

19-Jan-2007	14	D <sup>2</sup> PAK mechanical data has been updated and add footprint data.
31-May-2007	15	Order codes has been updated.
29-Aug-2007	16	Added Table 1 in cover page.
11-Dec-2007	17	Modified: Table 27.
06-Feb-2008	18	Added: TO-220 mechanical data Figure 38 on page 38 , Figure 39 on page 39, and Table 23 on page 37. Modified: Table 27 on page 58.
18-Mar-2008	19	Added: Table 29: DPAK mechanical data on page 50, Table 30: Tape and reel DPAK mechanical data on page 52. Modified: Table 27 on page 58.
26-Jan-2010	20	Modified Table 1 on page 1 and Table 23 on page 37, added: Figure 38 on page 38 and Figure 39 on page 39, Figure 40 on page 45 and Figure 41 on page 45.
04-Mar-2010	21	Added notes Figure 38 on page 38.
08-Sep-2010	22	Modified Table 27 on page 58.
23-Nov-2010	23	Added: TJ = 25 °C test condition in DVO on Table 3, 4, 5, 6, 7, 8 and Table 9.
16-Sep-2011	24	Modified title on page 1.
30-Nov-2011	25	Added: order codes L7805CV-DG, L7806CV-DG, L7808ABV-DG, L7812CV-DG and L7815CV-DG Table 27 on page 58.
08-Feb-2012	26	Added: order codes L7805ACV-DG, L7805ABV-DG, L7806ABV-DG, L7808CV-DG, L7809CV-DG, L7812ACV-DG, L7818CV-DG, L7824CV-DG Table 27 on page 58.
27-Mar-2012	27	Added: order codes L7812ABV-DG, L7815ABV-DG Table 27 on page 58.
27-Apr-2012	28	Modified: VI = 10.4 to 23 V ==> VI = 11.4 to 23 V test conditon value Line regulation Table 6 on page 13.
10-May-2012	29	Added: order codes L7806ACV-DG, L7808ACV-DG, L7815ACV-DG, L7824ABV-DG and L7824ACV-DG Table 27 on page 58.
19-Sep-2012	30	Modified load regulation units from V to mV in Table 3 to Table 9.
12-Mar-2013	31	Modified: VO output voltage at 25 °C min. value 14.4 V Table 16 on page 23.
04-Mar-2014	32	Part numbers L78xx, L78xxC, L78xxAB, L78xxAC changed to L78. Removed TO-3 package. Updated the description in cover page, Section 2: Pin configuration, Section 3: Maximum ratings, Section 4: Test circuits, Section 5: Electrical characteristics, Section 6: Application information, Section 8: Package information and Table 27: Order codes. Added Section 9: Packaging mechanical data. Minor text changes.
26-Feb-2016	33	Updated Section 8: Package information. Minor text changes.
28-Nov-2016	34	Updated Section 9: "Ordering information". Minor text changes.
25-May-2018	35	Updated D <sup>2</sup> PAK package Section 8.7 D <sup>2</sup> PAK (ASE) type B package information.
17-Sep-2018	36	Updated <a href="#">Figure 29. Dropout voltage vs junction temperature</a> .
